LOW FREQUENCY POWER AMPLIFIER

GENERAL DESCRIPTION

CD8227GP is audio power IC with built-in two Channels developed for portable radio cassette tape recorder with power ON/OFF switch. Thermal shut down protection circuit is built in. Because of the parts reduction and DIP (Dual in line package), space merit is remarkable.

FEATURES

- High Power
  \[ P_{\text{out}}=2.5\, \text{W/CH} (\text{Typ.}) \quad (V_{\text{cc}}=9\, \text{V}, R_{L}=4\, \Omega, f=1\, \text{kHz}, \text{THD}=10\%) \]
  \[ P_{\text{out}}=3.0\, \text{W/CH} (\text{Typ.}) \quad (V_{\text{cc}}=9\, \text{V}, R_{L}=3\, \Omega, f=1\, \text{kHz}, \text{THD}=10\%) \]

- Voltage Gain:
  \[ G_{v}=45\, \text{dB} (\text{Typ.}) \quad R_{f}=120\, \Omega, f=1\, \text{kHz} \]
  \[ G_{v}=56.5\, \text{dB} (\text{Typ.}) \quad R_{f}=0\, \Omega, f=1\, \text{kHz} \]

- Low popping noise at power ON

- Small Quiescent Current: \( I_{\text{ccq}}=21\, \text{mA (Typ.)} \quad (V_{\text{cc}}=9\, \text{V}, V_{\text{in}}=0) \)

- Ripple Rejection Ratio: \( \text{R.R.}=-52\, \text{dB (Typ.)} \quad (V_{\text{cc}}=9\, \text{V}, \text{ripple}=100\, \text{Hz}, R_{g}=600\, \Omega) \)

- Cross Talk: \( \text{C.T.}=-50\, \text{dB (Typ.)} \quad (V_{\text{cc}}=9\, \text{V}, f=1\, \text{kHz}, R_{g}=600\, \Omega) \)

- Output Noise Voltage:
  \[ V_{\text{no}}=0.3\, \text{mVrms (Typ.)} \quad (V_{\text{cc}}=9\, \text{V}, R_{g}=10\, \text{k}\, \Omega, \text{BW}=20\, \text{Hz} \sim 20\, \text{kHz}) \]

- Stand-By Switch

- Soft Clip

- Built-in thermal shut down protection circuit

- Best for supply voltage 9V

- Supply voltage range: \( V_{\text{cc}}=5 \sim 12\, \text{V} \)

SUM
TEST CIRCUIT & BLOCK DIAGRAM

*(1) This IC can be used without coupling capacitor (CIN). If volume slide noise occurred by input offset voltage is undesirable, it needs to use the capacitor (CIN).

*(2) The condenser between the ④ pin and the GND (C11) is for reducing pop noise when the power ON/OFF switch (SW1) is set to ON/OFF.

APPLICATION INFORMATION AND APPLICATION METHOD

1. ADJUSTMENT OF VOLTAGE GAIN

The voltage gain \( G_v \) is obtained as follows by \( R_1, R_2 \) and \( R_f \) in Fig.1.

\[
G_v = 20 \log \left( \frac{(R_f + R_1 + R_2)}{(R_f + R_1)} \right)
\]

When \( R_f = 0 \) \( G_v = 56.5 \text{dB (Typ.)} \)

When \( R_f = 120 \Omega \) \( G_v = 45 \text{dB (Typ.)} \)

By increasing \( R_f \), reduction of \( G_v \) is possible.

However, since the feedback increase is liable to produce oscillation, it is recommended to use this at 40dB or over.
2. THERMAL SHUT-DOWN CIRCUIT

The thermal shut-down circuit is built in for the purpose of preventing the destruction of IC due to the abnormal temperature rise when the heat radiation is insufficient.

The operation temperature is set at radiation F\text{in} temperature 175°C(Typ.)

At this temperature or over the bias is interrupted to prevent the destruction of IC.

3. INPUT STAGE

The input circuit of this IC is as shown in Fig.2. PNP TR: Q1 is provided in the input circuit so as to make its usage possible without the input coupling capacitor.

However, at pins ⑥ and ⑦, max 60mV offset voltage is produced.

Application after checking volume slide noise is recommended.

For cutting the volume slide noise, insert the input capacitor: C_{IN} in series to interrupt the DC component.

4. OSCILATION PREVENTIVE MEASURES

For oscillation preventive capacitor C6 and C7 between the output terminal and GND, it is recommended to use Polyester film capacitor having good characteristics for temperature and for high frequency.

Since the characteristics of the capacitor is liable to be influenced by the temperature, use this capacitor after the temperature test to check the oscillation allowance.

In addition, as the position of the electrolytic capacitor has a remarkable influence on the oscillation, connect C10 to Vcc at the nearest possible position from power GND.

At using this application with the voltage gain reduced, oscillation is liable to be produced. Apply the capacitor after checking enough for its capacity, type and mounting position.
As the oscillation allowance varies according to the printed pattern layout, the standard printed board is recommended to be referred to design it.

5. INPUT VOLTAGE

When the excessive signal is input, turning-up is produced in the clip waveform. The turning-up point is $V_{IN}=300\text{mVrms(Typ.)}$ : $V_{cc}=9\text{V}$, $R_L=4\Omega$, $f=1\text{kHz}$ : Enough care must be taken for this phenomenon.

6. POWER ON/OFF SWITCH

There is power ON/OFF switch at pin 1. However, output power is changed by pin 1 supply voltage when pin 1 voltage in not same pin 12 supply voltage, after referring to attached date, select pin 1 supply voltage.

7. GND LINE

GND pin is not separated for Pre-GND and for Pw-GND. That is liable to cause distortion and cross talk worse. Before use this IC, please check it.
